In vivo absorption and disposition of benzyl and phenethyl isothiocyanates and their glucuronides in rats. The absorption and disposition of benzyl (B) and phenethyl (E) isothiocyanates and their glucuronides were studied in rats following administration by gavage. Urine and feces were collected for 24 h following administration. Recovery of isothiocyanates from urine and feces were determined by a combination of RP-HPLC and a GC-EI/MS. The isothiocyanates were quantified by the internal standard method. The absorption of isothiocyanates from an aqueous solution was biphasic. The high absorption phase was followed by a very low absorption phase. The majority of the absorbed isothiocyanates were excreted in the form of their glucuronides. The glucuronides were hydrolyzed to isothiocyanates before being excreted.

Q: Dynamic Recursive SQL I have some table with two column of a date value. So I need to do this : if (fecha1 = fecha2 AND fecha1 > today) { echo "true" } I need to find a way to do this in a single SQL query instead of "if" statement.. Someone can help me? A: You can write this as a function: CREATE FUNCTION check\_date (fecha1 date, fecha2 date, today date) RETURNS boolean AS \$\$ BEGIN RETURN (fecha1 = fecha2 AND fecha1 > today) END \$\$ LANGUAGE plpgsql; SELECT check\_date('2017-01-01', '2017-01-01', '2017-01-02'); If you are using Postgres 9.3 or higher you can use the new FILTER clause: CREATE FUNCTION check\_date (fecha1 date, fecha2 date, today date) RETURNS

Esophageal motor disorders are the leading causes of dysphagia after esophageal surgery. Redo esophageal myotomy is an effective treatment for persistent esophageal motor disorders. A prospective study was conducted to investigate the efficacy of redo esophageal myotomy for the management of persistent esophageal motor disorders. The patients were divided into two groups based on the initial surgical treatment: redo esophageal myotomy or redo Heller myotomy. Symptom severity was assessed using the dysphagia score of the upper gastrointestinal symptoms questionnaire, and radiological examinations were performed to detect esophageal dysmotility and intramural gas. A total of 67 patients completed follow-up over 6 months. Compared to the control group, the redo esophageal myotomy group had a significantly higher satisfaction rate (85 2d92ce491b
