

The best spam-filtering is done on the receiving end, in which case your email is more likely to be filtered at the right point in the mail process. More on that is in this question: A: There is no good spam filtering unless you have some control over the source or the content. To add to that a new spam filter can be used by email providers to show advertisements in the email body. That is a never ending game. This is why you should always use your own filters for filtering spam. There are so many things that can go wrong in a email, and spam detection is just one of the many. If you want to be sure to get your spam free, then be prepared to wait. Even if you already have all your servers and equipment running smoothly, spam might still get through. You should know that, in your business, there are basically 2 ways to get your spam filtered out. Do it yourself: use a host-based spam filtering, or a scanning-based spam filtering. Ask the hosting provider to do it for you. So, if you're going with the first option, you must make sure that the server you're using is capable of filtering out spam. That may not be the case of your provider. I won't get into how to design a good spam filtering, but I can tell you it's not enough to have a good AntiVirus. You need a good AntiSpam. The second option is even less sure of being successful, because a lot of host companies do not filter spam automatically. If you have to choose one, I would go for the first one, but you should have in mind that, in the long term, you'll probably have to spend money to buy equipment, and if you decide to go with option 2, the hosting provider will probably try to persuade you to purchase additional equipment, or will offer you a discount if you go for it. This application claims priority from German Patent Application No. 103 59 167.6, filed Feb. 22, 2003, the entire contents of which are incorporated herein by reference. The present invention relates to a structure for use in a fiber optic switch matrix, particularly for optical fiber communication networks,
