Silverlight SDK installation Installing the SDK is done as an administrator. The installation requires internet connection. You will be prompted for a couple of license agreements. The first one should be accepted by default, and the second should be processed only if you are about to make a site modification. If you encounter any problems when installing the SDK, you can refer to the knowledge base in the SDK installation manual. C++, C# and .Net Silverlight is based on the .Net Framework, and the first step is to install the .Net Framework. Silverlight Silverlight is a .Net-based browser-based framework that was designed by Microsoft. It has a built-in support for viewing multimedia files. The supported multimedia files are MP3, WMV, AVI and XPS. The installation process of the Silverlight SDK is the same as the installation of the SDK, but you should select the runtime environment instead of the SDK. You will be required to accept the terms and conditions. Once you have installed the runtime environment, you can run the samples. The samples that you can run with the SDK have their own instructions. You can start with these samples if you don't have an idea about how the SDK works. If you have an idea of what you want to create, you can build your own Silverlight projects. You can write code in .Net and Visual C#. The project is built in Visual Studio. The samples contain a small description of the language that you can use to create your own code. The description is written in a generic way and cannot be used to get the specific information about the language. However, if you need to know how a particular command works in the language, you can refer to this document. Microsoft Silverlight SDK - What's new? A number of changes have been made to the interface of Microsoft Silverlight SDK over the last couple of months. One of the important changes is the way in which the SDK is licensed. In the past, the SDK was made available with a software product license. This meant that you could only use the SDK for creating software and apps that belonged to a single company. The new version is a software product with an end user license agreement (EULA). The new EULA is not that complicated. It just ensures that you can use the SDK for creating software programs for your company or for the customer. The terms

Microsoft Silverlight SDK is a package that includes the most important libraries required by developers to create Silverlight compatible applications. It is the backbone of every Silverlight implementation and includes the tools required to build and to package the programs. Enabling creation of Internet and mobile phone applications The Silverlight framework is designed to help developers create rich Internet applications that can be delivered to the users via Internet browsers such as Internet Explorer, Firefox or Chrome. The framework is a viable solution for developing mobile device apps for the phones that use Windows Phone or Symbian operating systems. Easily build multimedia content You can use the components to build applications that support media steaming, graphics and animations as this is the main purpose of the framework. The end user only needs to install the run-time environment in order to use the browser enhancement. Easy deployment of needed tools The installer deploys the Silverlight Libraries that include the extensions, the user controls and the server controls. It also includes the Reference Assemblies and the builder components required to prepare the app for use. Cleverly organized resource libraries The libraries are organized into folders and use a prefix in order to make them easy to find the tool that you require. For instance the libraries with the System.Windows.Controls prefix are designed to create new controls which enable the user to communicate with the interface. This software development kit allows you to start creating your Silverlight programs. You have to choose if you want to use a simple text editor to write the code or to use a professional tool such as Visual Studio. To sum it up All in all, Microsoft Silverlight SDK is a package that contains nearly anything you need to develop Silverlight applications. However, beginners might have a difficult time, as it is mainly addressed to those with a little bit more coding knowledge that just the basics. Learn to code from a complete computer software development kit (SDK) with free and powerful visual tools that you can use right away! This software development kit includes a whole project that includes full functions like windows forms, data access (oracle), website creation (asp, php), etc. A computer software development kit is a set of tools that are used to develop and debug software. Unlike an integrated development environment, a computer software development kit consists of a variety of tools that are not usually available in a single integrated environment. In some cases, a computer software development kit includes a computer software development environment (such as Microsoft Visual Studio) in addition to other tools that

Silverlight is a free runtime environment that enables you to create compelling interactive applications for the Internet browsers. The Silverlight 3.0 SDK is a rich set of software development kits for .NET developers. Silverlight 2010 Runtime enables you to develop and run Silverlight applications. This Silverlight software development kit includes the run-time environment, the extensibility model and the framework. It also includes the tools required to package and to deploy the programs to the users. Silverlight 3.0 SDK is a package that contains nearly everything you need to develop Silverlight applications. However, beginners might have a difficult time, as it is mainly addressed to those with a little bit more coding knowledge that just the basics. Silverlight 3.0 SDK allows you to create and develop programs that support the Silverlight framework, which includes the components that you need to start developing. This package includes the reference assemblies and the tools that are needed to deploy the apps to the users. The Silverlight run-time is a runtime environment that enables you to create applications that can be executed in a browser without the need to install anything. Advantages of using a HTML5 Web Server for Silverlight Browser extensions are plug-ins that include the extension of existing features. They add additional functionality to the application, but at the same time also take control of some of the existing application. You can use the plug-in approach to create products that include web-based solutions. The plug-ins add to the functionality of the application, and do not take control over it. The plug-ins also need not run in the main application, and can be run independently of the main application. When you use the plug-in approach, you can easily share the plug-in code. If you create a plug-in that uses some other plug-ins, you will not need to re-create those features for your application. Instead you only need to refer to the correct extension points. The main benefit of the browser plug-in approach is the reduced code load for the web server. If you have a web server running on the same machine as the main application, there will be no need to include the plug-in with the main application. The plug-in approach also allows you to deliver the application as one unit. This is mainly achieved by using the ready-to-deploy solution. On the downside, it is not possible to debug or to test the plug-in in the browser environment. This means that the plug-in is not compatible with the existing Windows OS browser and with the Internet browsers. It also means that you need to run the application in the browser to test the plug-in functionality. This requires that the
