What's New In?

DVD Identifier is a utility designed to help you find out various technical information on your DVDs. It can be seamlessly handled, even by less experienced users. Since installation is not necessary, you can store DVD Identifier on a USB flash drive and directly run its executable file on any computer. What's more important is that the Windows Registry is not updated with new entries, and that you can carry the app with you whenever you're on the move. The app is packed in a plain and intuitive interface where you can select the drive from a drop-down list. For instance, you can view details regarding the BD-R/-RE, HD DVD-R/-RAM, DVD+R/+RW, DVD-R/-RW or DVD-RAM, such as the disc type, manufacturer name and ID, media type ID, product revision, stamper date, layer info, blank disc capacity and recording speed. Additional information may be read on the bottom part of the window when it comes to the status, drive capabilities on the respective disc and 'media code'-block. These details can be copied to the Clipboard for further revision. From the 'Settings' area, you can configure proxy settings and select the drive interface mode (e.g. automatically select the interface, system ASPI layer). Plus, you can reset the window size and check out user documentation. The program is very responsive to commands and runs on a very low amount of CPU and system memory. We have not come across any problems during our testing; DVD Identifier did not freeze, crash or pop up error dialogs. All in all, DVD Identifier should come to the aid of all users who want to find out technical details related to their DVD discs. Statement Please be aware that Brothersoft do not supply any crack, patches, serial numbers or keygen for DVD Identifier, and please consult directly with program authors for any problem with DVD Identifier. I would like to get the name of the file which matched the pattern and also the file name of the file I got it from inside a given directory. For example, I have two directories A and B. A has files a.1, a.2 and a.3. B has files b.1, b.2, b.3. I want to search in A for all files matching a.1, whose modification date is after 2016-01-01. I should get b.1, b.2 and b.3.
