objects, such as arc length, bearing, and width. Existing drawing objects retain their existing attributes. The attributes of imported objects are based on imported values, not imported objects. Create new auxiliary objects in the Attributes Window and name them after the object types they contain (for example, dimension lines contain object names that are not editable). View and edit the object names for each auxiliary object in the

Attributes Window. Create a relationship line between an imported auxiliary object and a host object. After creating the line, the Auxiliary Object option in the Properties Window can be used to see and edit the object name.

Change the visual appearance of existing imported auxiliary objects in the Attributes Window. Drag and drop imported auxiliary objects onto host objects in your drawing, and the auxiliary objects automatically

show up in the drawing. Add lists and layers to drawings for easy and secure editing. Edit and drag to a new position. Create a new level in the drawings tree and use the Levels tool to give an overall appearance to the drawing. Add and subtract views in a viewport. Draw and edit labels. Draw and edit complex shapes. Add custom fields to controls. Link controls on the command bar to subdrawings to automate commands and prevent command errors. Copy

and paste objects to other applications. Reorder and customize objects in your drawing to make it easier to organize. Create a dynamic dashboard to track drawings in progress. Create a drawing template to modify visual appearance and behavior for a new and recurring drawing. Create a new datum in a drawing with an exact location. Add custom tools to the drawing toolbox.
